€ 18.00

Epipremnum aureum 'Global Green' is a tropical houseplant with outstanding leaves. Different from other varieties, this plant shows light green patterns on a dark green leaf surface. It is a fast-growing plant species suitable for growth in living rooms and greenhouses.

Adult width:

### Product info

Epipremnum aureum 'Global Green' is a cultivated plant from the aroid family. In nature, species from this genus are called 'Devils Ivy'. This is because of the fast-growing nature of this plant, where it could easily take over whole tropical trees in a relatively short time. This plant is invasive in large parts of tropical southeastern Asia. The variety 'Global Green' is rare and differs from other varieties by the coloration and shape of the spots of the leaves. This plant has fresh light green colored patterns that contrast sharply to the dark green background. The species forms large rhizomes from which the heart-shaped leaves and aerial roots grow. Propagation is easy by taking cuttings of the rhizome and letting them root in water or specialized soil.

Height:  
16 cm

Width:  
14 cm

## Plantcare

*Epipremnum aureum* 'Global Green' is a relatively easy to grow aroid and suitable for beginners. Provide this plant with a warm environment above 16 degrees. The warmer the temperature, the faster the growth. Allow for a humidity above 70%, lower humidity levels are tolerated. Place this plant in a bright space with direct morning or evening sun. Try to avoid direct mid-day sun as this could burn the leaves. Pot this species in humus-rich soil that holds water well. Do not let this plant dry out for longer periods of time. Fertilize this plant monthly with plant feed for green tropical plants, according to recommended dosage.
